The script to use is Extplorer (<http://extplorer.sourceforge.net/>)

The script is standalone and no installation or database is needed.

Changes needed:

1. Disable and remove source code for the following features:
 - Login/Logout, Admin, users
 - CHMOD
 - Upload / FTP
 - About button – (just hide)
 - New file/link (only keep new folder option)
 - Balloon tip on folder tree (just hide)
 - -quick jump to
 - Add to favorites (just hide)
 - Current mode line (just hide)
 -
2. User will only see and access his own folder, but not Extplorer files or root folder or any other folder, you can use subfolder to store user's files and Extplorer files will be in user folder.

The reason is to prevent hacking.

3. Remover gray header and move languages menu to blue upper line.
4. Display – hide 'type','perms' and 'owner' columns,
5. Display – add 'Author' and 'subject' columns (will display the data from file summery).
6. Fix 'view' feature to display PDF correctly. (if its complicated drop this one)

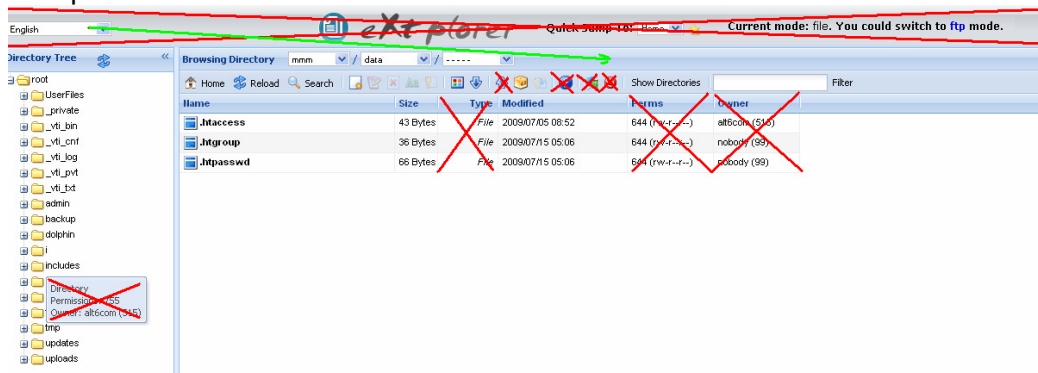

Notes:

User's folder location is:

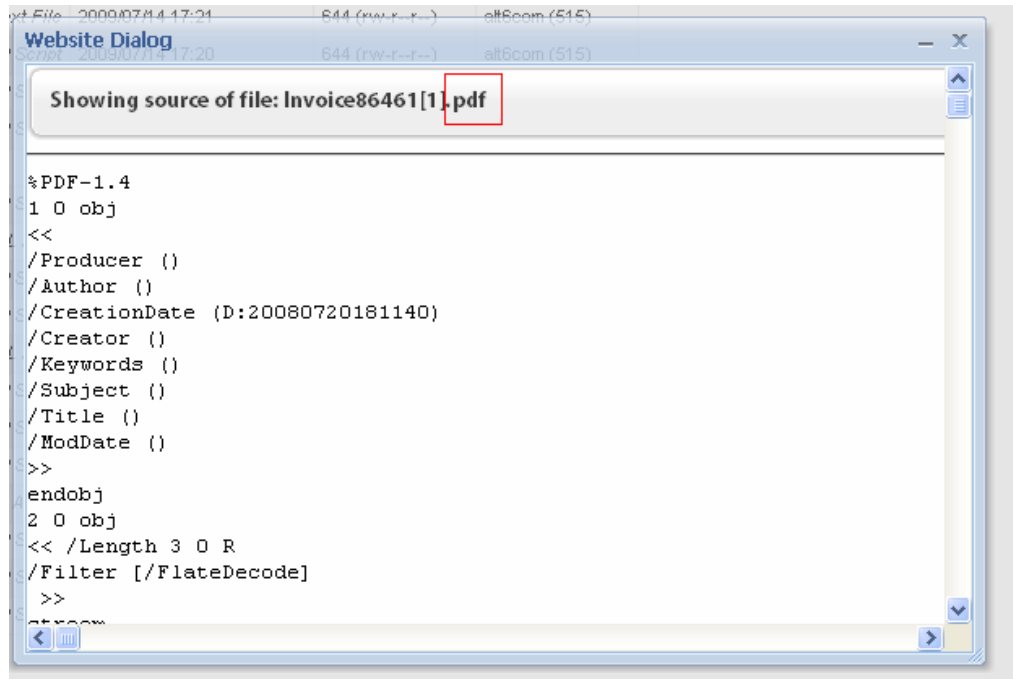

<http://www.mysite.com/members/users/XXX>

where XXX is the username.
